

CardSaver™ VoIP Billing & Management

INTRODUCTION

CardSaver™ is a complete billing and management system that allows companies around the world to offer standard and pinless prepaid calling cards, IP Phone, call back, call shop, and wholesale termination services.

CardSaver™ is currently used in over 60 countries in 6 continents around the world for both wholesale and retail telecom businesses.

PREPAID CALLING CARDS

Hundreds of our clients around the world use CardSaver™ to offer prepaid calling services to their customers. With CardSaver™, you can automatically generate up to ten million cards and access detailed information for each card. It allows you to produce up to 100,000 different brands of cards, and each brand can have its own set of rates and fees.

PINLESS CALLING SERVICES

CardSaver™ can be used to process calls based on the Caller ID of the caller. In this case, the caller does not have to enter a PIN. You can set the account to work as a prepaid or postpaid product. In the case of Prepaid, the subscriber must have funds deposited. In the case of postpaid, you simply send a bill to the subscriber based on the information you receive from CardSaver.

CALL SHOP SERVICES

CardSaver allows clients to provide prepaid and postpaid calling services within call shops, Internet cafes, and VoIP shops. With a single installation, you can handle up to 75 call shops and over 500 simultaneous calls. Provisioning new call shops and stations, reporting daily activity, and managing call shop customers is extremely simple with the web-based management tool we provide.

RATES AND FEES

Flexible rate plans and fees are critical components to success in the telecom service industry today. CardSaver allows clients to specify detailed rates to any location in the world. CardSaver also allows clients to set unique activation, connection, disconnection, usage, and maintenance fees for any account that you choose.

E-COMMERCE STORE FRONT

As an optional feature, CardSaver™ offers an e-commerce storefront that includes credit card integration with Authorize.net, Pay Junction, Cybersource, and Google Checkout. The system assigns each cardholder a login ID and password that they can use to view their call history and recharge their accounts using their credit card.

SUPPORTS SIP PHONES

CardSaver™ allows clients to start services similar to Lingo or Vonage with the use of SIP Phones. CardSaver™ can authorize calls from these phones using their unique username and password allowing you to securely provide both prepaid and post-paid solutions for these customers. Customers can login to the system and view their call history and account balance.

RESELLER NETWORK

Whether you are selling your services directly to customers or through distributors, at brick and mortar establishments or online, CardSaver allows you to build a commission-based reseller network. The reseller network allows you to pay out up to two levels of commission to your resellers, which will encourage them to sell your services and also to recruit others to sell. This reseller feature has been proven to generate revenue.

USER-FRIENDLY, POWERFUL INTERFACE

Using a web browser from anywhere in the world, your administrators, agents, customer service reps and customers can login to CardSaver and manage their accounts. To customize the interface for specific users, administrators can choose from a list of permissions to grant to their customer service reps and agents. The user interface provided to users is intuitive, friendly and takes only minutes to learn. The interface provides powerful tools that allow the users to easily access important call and transaction information.

EXTENSIVE REPORTING

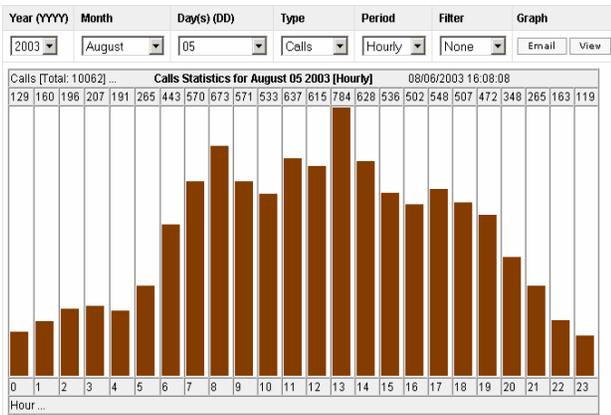

CardSaver™ offers extensive reporting capabilities for both the wholesale and card account modules of the software. For the wholesale industry, you can view graphs and breakdowns based on the destination or the IP Address of calls. For your calling card products, you can view reports to see the performance of your distributors. You may also view when cards were activated or expired during a particular time period. In addition, you can analyze your account holders' calls to see where and when they are calling to develop new business strategies to maximize your business profits.

MULTIPLE LANGUAGE SUPPORT

We live in a world in which your services need to support multiple languages at the same time. CardSaver, in conjunction with the correct VoIP Gateway, can support different languages based on the customer that is calling. Some languages that are supported are English, Spanish, French, German, Arabic, Russian, Farsi, Turkish, Mandarin, and Cantonese.

ONE CLICK GRAPHICAL DISPLAYS

From your Internet Browser, you can access the CardSaver™ Administrative Panel. With a few quick clicks of the mouse, you will see call counts and detailed graphs for the time period you specify. This allows you to quickly view and analyze your high traffic hours, revenue generated, ASR, and average call durations.

RECHARGE ACCOUNT OVER THE PHONE

As an optional feature, CardSaver™ offers an IVR system that allows your customers the convenience to recharge their accounts via the telephone. Tied to the Authorize.net or Pay Junction platforms, this will allow your customers to use their credit card to instantly increase their balance on their accounts.

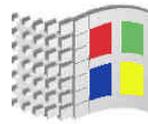

RADIUS SERVER

CardSaver™ is compatible with the Remote Authentication Dial In User Service (RADIUS) enabled VoIP Gateways. This protocol is used by most of the VoIP gateways manufactured by companies including Cisco, Quintum, Nextone, AudioCodes and more.

MySQL DATABASE

CardSaver™ uses the MySQL database engine. MySQL is a high performance, high capacity database that is one of the easiest databases to manage and use.

WINDOWS BASED

CardSaver™ runs under Microsoft Windows Server / Professional Series Operating Systems. This makes it simple for you to operate your system and use your knowledge of the Windows software.

TURNKEY PRODUCT OR SERVICE

PEC offers solutions for all levels of customers whether you have an existing platform or are new to the business. PEC can provide both software and hardware to its customers whether they require a small or large platform. As a client, you have an option of purchasing the system outright or leasing a hosted system at PEC's New Jersey or New York City locations.
